

Design an Attractive Flower

Amazing Fact

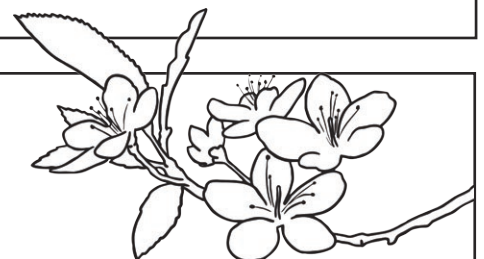

The 'rat's tail' plant, found in South Africa, has evolved a perch as a way to attract the feeding birds which pollinate it (help it to make seeds).

Challenge

Plants need birds to pollinate them, so that they can grow in lots of places and have a better chance of survival.

Design a plant which would attract birds and which makes it easy for pollen to attach to the birds legs, beak or wings. Make sure it is bright and colourful!
